

SSO Integration with Adobe Admin Console

Implementation Overview

How Multi-SSO Works in Adobe Admin Console

Implementation Phases

Phase 1: Directory Setup via Azure OIDC

Phase 2: Domain Configuration

Multiple Domains Example

Phase 3: User & Group Provisioning (SCIM Integration)

Objective:

Steps:

Special Note: If Only Users Are Provisioned

Outcome

Requirements from SSB

1. Point of Contact
2. Azure Entra ID Admin Access
3. Domain Ownership & Configuration
4. User & Group Structure (Input from SSB)
5. SCIM Configuration Support

Additional Clarification:

What if Azure does not sync groups?

Existing User Group Mapping

Admin Console Group to AEM User Group Mapping

Implementation Overview

How Multi-SSO Works in Adobe Admin Console

- Admin Console uses **directories** to map authentication methods to email domains.
- Each **claimed domain** is associated with a directory and its own **authentication method** (SSO or otherwise).
- On login, Adobe Admin Console matches the **user's email domain** to the correct directory and routes accordingly.

Implementation Phases

Phase 1: Directory Setup via Azure OIDC

- Create a new **directory** in Adobe Admin Console.
- Authenticate into the **Azure Entra ID** tenant with admin privileges.
- Use **OpenID Connect (OIDC)** method to establish the trust between Azure and Adobe.
- Follow the wizard to:
 - Provide metadata
 - Set up client secrets/certificates

- Validate the connection

Outcome: Adobe Admin Console can communicate with Azure AD for authentication.

Phase 2: Domain Configuration

- Add domains to the newly created directory in Admin Console.
 - Domains can be **added manually**, or
 - Use **Azure AD sync** to import domains automatically.
- Adobe will perform domain verification (DNS validation might be required).
- Ensure each domain points to the correct directory and auth method.

Multiple Domains Example

Example:

If the customer has both `@sertasimmons.com` and `@tuftandneedle.com` domains:

- Both domains can be added and verified under the **same directory** in Admin Console.
- As long as they are verified in **Azure Entra ID** and share the same **SSO setup** (OIDC), they can be managed under one unified directory.
- Users from either domain will be routed correctly during login based on their email domain.

Outcome:

All configured and verified domains will be associated with the correct directory. Users from these domains will be properly recognized and routed through the corresponding SSO flow during login.

Phase 3: User & Group Provisioning (SCIM Integration)

Objective:

Set up automatic user and group provisioning from Azure Active Directory (Entra ID) to Adobe Admin Console using SCIM. This streamlines user onboarding, ensures consistency, and reduces manual administrative work.

Steps:

1. Enable SCIM Integration in Adobe Admin Console

- Navigate to: Admin Console → Settings → Directories → Azure Directory → Sync
- Click "Azure Sync Login"
- Have the Azure AD administrator log in and authorize Adobe provisioning
- This sets up the connection between Azure and Adobe using Adobe's native SCIM integration

2. Configure SCIM Provisioning in Azure Portal

- In the Azure Portal, go to: Azure Active Directory → Enterprise Applications → Adobe Creative Cloud
- Open the Provisioning tab
- Set "Provisioning Mode" to "Automatic"
- Confirm successful connection to Adobe Admin Console

3. Set Up Attribute Mappings

- Ensure that key attributes like `userPrincipalName`, `givenName`, and `surname` are correctly mapped to Adobe user fields
- The email address (`userPrincipalName` or `mail`) must match existing users in Adobe Admin Console to support automatic conversion to Federated ID

4. Configure Group Provisioning

- In Azure AD, assign users to Azure groups (e.g., SSB-Assets-Team, SSB-Sites-Editors)
- Assign those Azure groups to the Adobe Creative Cloud enterprise application
- These groups will be provisioned into Adobe Admin Console and can be mapped to product profiles

5. Map Groups to Product Profiles in Adobe

- In Adobe Admin Console: go to Products → AEM Assets / AEM Sites → Product Profiles
- Map the synced groups to appropriate product profiles
- This enables automatic license and permission assignment to users based on their Azure group membership

Special Note: If Only Users Are Provisioned

If SCIM provisioning is configured to sync only users (and not groups):

- Users will appear in Adobe Admin Console as Federated ID users
- However, they will not be assigned to any product profiles automatically

- Manual assignment of these users to the appropriate product profiles will be required in Adobe Admin Console

This approach works but limits automation. It is strongly recommended to enable group-based provisioning in Azure to allow automatic role and license assignment.

Outcome

Once SCIM is fully configured:

- New users added to Azure will be automatically created in Adobe Admin Console
 - Existing users with matching emails will be converted to Federated ID and directed to log in via SSO
 - Users will automatically be assigned or unassigned to products based on their Azure group membership (if group sync is enabled)
 - Identity management is streamlined and centralized in Azure AD
-

Requirements from SSB

To successfully implement SSO integration and SCIM provisioning via the Adobe Admin Console using Azure Entra ID, we require the following inputs and actions from the Serta Simmons Bedding (SSB) team. These are necessary to ensure seamless user authentication, license assignment, and access management for AEM Sites and Assets.

1. Point of Contact

A technical contact from SSB who understands or manages the Entra ID (Azure Active Directory) environment.

Why this is needed:

- They will assist with configuring SSO, enabling SCIM, and verifying domain ownership
 - They will coordinate with Adobe team to troubleshoot or validate directory sync issues
-

2. Azure Entra ID Admin Access

SSB must provide an administrator with sufficient access to the Azure tenant used for identity management.

This access is needed to:

- Register and authorize the Adobe SSO (OIDC/SAML) application
- Set up and configure SCIM provisioning between Azure and Adobe

- Generate client secrets or certificates if required during the integration process
-

3. Domain Ownership & Configuration

SSB must share:

- A list of all email domains used by internal users (e.g., @sertasimmons.com , @tuftandneedle.com)
- Clarification on whether these domains are all managed within one Azure AD tenant or across multiple
- DNS access for any domain not previously verified in Adobe Admin Console

Why this is needed:

- Adobe requires domain claiming to enforce SSO login and convert Adobe ID users to Federated ID
 - DNS TXT validation may be required to prove domain ownership
-

4. User & Group Structure (Input from SSB)

While the actual product profiles and user roles for **AEM Sites** and **Assets** are defined on the Adobe side (as per the Solution Design), SSB must share how users are currently grouped in Azure AD.

What we need from SSB:

- Mapping or list of Azure AD groups (e.g., SitesAuthors , AssetsViewers , Designers)
- Information on how those groups are maintained (e.g., Security Groups, Microsoft 365 Groups)

Why this is needed:

- To map Azure groups to Adobe product profiles for automatic license assignment
 - To ensure SCIM provisioning assigns users to the correct groups without manual intervention
-

5. SCIM Configuration Support

SSB must agree to enable and configure SCIM (System for Cross-domain Identity Management) provisioning in Azure.

Why this is needed:

- SCIM allows Azure to automatically create, update, or remove users in Adobe Admin Console

- Group-based SCIM provisioning enables automatic role assignment (no need for manual mapping later)
 - SSB must help define rules for who should be provisioned (e.g., only full-time staff, specific groups, etc.)
-

Additional Clarification:

What if Azure does not sync groups?

If SCIM is configured to sync **only users**, but **not groups**, then:

- Users will be created in Adobe Admin Console as Federated ID users
- They **will not be assigned to any product profile or role automatically**
- Adobe Admins will need to **manually assign each user** to the appropriate product profile for Sites or Assets

This approach is possible, but not recommended for long-term scalability. For a fully automated provisioning flow, **Azure groups must be mapped to Adobe product profiles**.

Existing User Group Mapping

If we decide to proceed with the **pre-existing user groups** currently present in the Adobe Admin Console.

This mapping will help:

- Determine if these groups can be **mirrored or reused** in Azure AD
- Align them with the correct **product profiles** in Adobe Admin Console
- Ensure a **smooth SCIM integration** by matching Azure AD groups to Adobe roles

Using existing groups (if they meet the requirements) helps avoid unnecessary duplication and speeds up the provisioning setup.

Admin Console Group to AEM User Group Mapping

Admin Console User Group ID	AEM User Group ID (which has ACLs)
AEM Assets Level 1 External - All Brands	level-1-external-all-brands

AEM Assets Level 1 External - Serta Only	level-1-external-serta-only
AEM Assets Level 1 External - BR-Simmons-BeautySleep-T&N Only	level-1-external-br-simmons-beautysleep-tn-only
AEM Assets Level 1 External - BR-Simmons-BeautySleep only	level-1-external-br-simmons-beautysleep-only
AEM Assets Level 1 External - BR-Simmons-BeautySleep-Serta Only	level-1-external-br-simmons-beautysleep-serta-only

AEM Assets Level 4 Creative	level-4-creative
AEM Assets Level 5 Admin Creative	level-5-admin-creative
AEM-DA-Administrators	Provides administrator-level access, including the ability to write configurations across all SSB organizations
AEM-DA-Authors	Write content within SSB organization
AEM-DA-Beautyrest-Authors	Write content for Beautyrest

AEM-DA-Serta-Authors	Write content for Serta
AEM-DA-Tuftandneedle-Authors	Write content for Tuftandneedle

How to use:

- **Admin console user groups** listed in the left column are mapped to corresponding **AEM user groups** (with ACLs) in the right column.
- Assigning a user to a group in the Admin Console will automatically place them in the corresponding AEM group controlling permissions (ACLs).

Note: If you encounter the error *“Failed to authenticate with Adobe ID”* after entering a wrong email ID, please try logging in again with the correct email ID using a Guest or Incognito browser window.
