

Current State Architecture

Author creates offer in Marketing Cloud Instance

rawHTML of default offer is copied to TFS AEM on prem Instance as XF

Dynamic Merchandising Offer component on aem pages is authored for placement code and default offer xf path

On page load client side call to Adobe Target/AEP , it returns personalized offers as xf HTML

If AEP/Target do not return offers /response default offer is shown

Assumptions

- ❑ Offers are authored on the Marketing Cloud instance and then pushed to Target/AEP from the Marketing environment.
- ❑ The Marketing Cloud instance and the TFS AEM instance maintain separate code repositories; there is no shared/common codebase between them.
- ❑ Currently, offer HTML is delivered as Experience Fragment (XF) HTML, while styling is applied through CSS and JS loaded from the global header.
- ❑ The files dm-offers/dm-offer-style.css and dm-offers/preload.min.js are responsible for offer styling and are loaded via the global header.
- ❑ PDP, Commerce (cart), search etc., are other systems that also consume offers from AEP/Target. No offers are created for them in the TFS AEM instance.
- ❑ At present, no offers are authored directly in the TFS AEM instance; only the default XF-based offer HTML is replicated there.
- ❑ Images in offers are served from Dynamic Media. The TFS AEM On-Prem instance does not have Dynamic Media, but the Marketing Cloud instance have Dynamic Media enabled.
- ❑ Offer placement in the Header and Footer comes from the Header and Footer HTML, and the Dynamic Merchandising Offer component is not used for its authoring. This component is used for showing offers in other places on pages other than the Header and Footer.
- ❑ **Interact Client Context on the Thermofischer site is needed or is part of legacy — confirmation needed.**
- ❑ AEP/Target requires country, language, and user type information for decisioning. This data is currently derived from the EDS page URL structure and browser cookies.

Option 2 :- Consume Offers from Marketing Team (Recommended)

- ☐ Marketing team continue author offers in their instance
- ☐ No migration is required for existing offers hosted in the Marketing AEM instance. Only the default offer Experience Fragments (XFs) available in the TFS AEM On-Prem instance need to be migrated to Fragments. Offers created under below path are **in scope- /content/experience-fragments/tfsite/us/en/site/dm-offers**
- ☐ No Impact on Other systems that are consuming offers directly from AEP/Target
